Now think ClearRack when you think cloud

Fully Customizable **Cloud Hosting, Dedicated and Hybrid Servers** that are flexible, easy to use and cost effective.
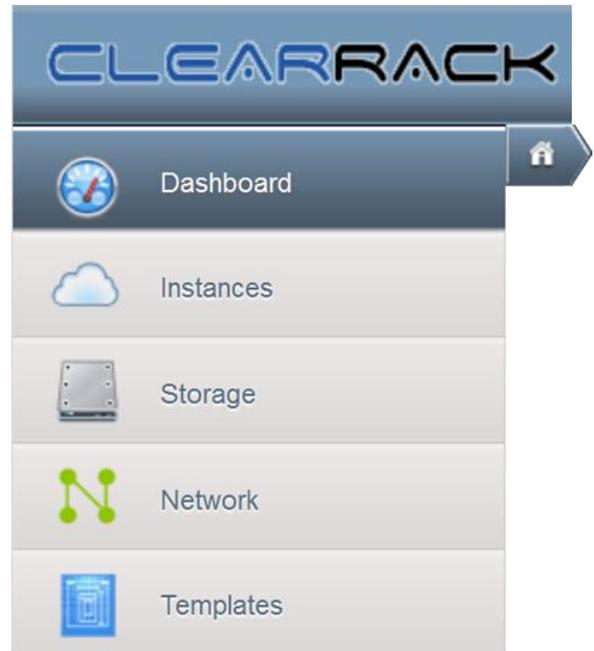

Cloud Hosting

When you need to spin on a dime and scale up rapidly to meet a surge in demand or cut back to control costs, ClearRack is there with the ultimate in flexibility, scalability, ease of use and affordability.

Our customers enjoy substantial savings over in-house solutions and those of other cloud providers. Couple that with the assurance that your data is not bouncing around the re-hosting stratosphere but safe in an ultra-secure data center that's managed 24/7/365 by a team of seasoned, dedicated professionals. **Isn't that what you'd really like to expect when you think cloud?**

- ▶ Create servers instantly
- ▶ Scale up and down to meet demand
- ▶ Select from multiple Operating System, RAM and Disk options
- ▶ Pay-as-you-go, by the hour or monthly

Creating you Server is a Snap

ClearRack provides you with your own intuitive, easy to use dashboard. The wizard glides you through provisioning with predefined configuration templates, and gives you the option to load an existing template from an ISO image or to create your own. Select the RAM and disk size you want, name your network, click Launch and you're done.

When ClearRack creates cloud instances, an optimized default network configuration is generated automatically. All the user has to do is give it a name as part of the setup process.

Once your Instance has been created, you can monitor your virtual machine's status, view usage statistics and check IP addresses.

You can stop and restart your virtual machine. With your machine in stop mode, you can even reconfigure the RAM and CPU options you selected in the Compute Offering step—**something that other cloud server providers don't allow.**

Virtual machines

● Running VMs   ● Stopped VMs   ◉ Total VMs

Adding IP addresses. IP addressed are generated automatically, and all virtual machines created in an account are initially set up to share the same IP address. This eliminates the upfront cost and challenge of managing multiple IPs.   If additional or dedicated IP addresses are required , they can be generated and assigned by ClearRack for $2.00 each.

Storage. ClearRack allows you to take a snapshot, a point-in-time record of your data that serves as a guide to allow you to revert back to a known good state in the event of corruption or failure.

In addition to taking snapshots manually, you can set up a schedule to have them taken and stored automatically at regular intervals. Capture your data image once a week, twice a week, once a day—any time frame that works for you and your business.

To make the best use of your disk space, you can manage how long your snapshot data is stored. The system allows you to establish retention limits by the number of days your data is kept, or by the number of snapshots that are kept.

Dedicated Servers

Does your disk drive utilization justify using a full server? Do you have to conform with security or compliance standards that require a dedicated server? Does your application require that you not share space or resources?

There are times when it just makes sense to host your data in a dedicated server.
▶ Security related compliance requirements
▶ Complex or proprietary applications require-ing recoding
▶ Intensive high speed I/O jobs
▶ Complete configuration flexibility

Hybrid Hosting

ClearRack hybrid hosting allows you to mix and match cloud and dedicated servers in the same environment, taking advantage of the benefits of each to fit the specific needs of the application.
▶ Host your relational database on a dedicated server while letting test and development platforms, batch processes and storage routines exploit the flexibility of the cloud.
▶ Keep your credit card transactions on a dedicated server in order to conform with compliance requirements and audits while serving your dynamic product data from the cloud.
▶ Keep your intensive I/O operations on a high performance dedicated server while your web applications scale up and down on the cloud through traffic spikes.

ClearRack—Hosting Options for All Jobs and Workloads
